

Deangelo M. Enriquez

As same as the first exam, I graded myself based on different categories that will determine my overall performance, and these are:

1. The amount of time and effort exerted from this project – 30/30

I give myself a perfect score because I've spent a lot of time and effort on making this project possible. In line with the rule, there are times that I exceed more than three hours a week in accomplishing each section for the project. I spent a lot of time because I studied first how to code and style my portfolio using HTML and CSS. However, I didn't implement JavaScript as there are parts where it is too complex for me to study.

2. Aesthetic Appeal – 18/20

As someone with a good eye for graphic designs, I am confident that my portfolio has shown an aesthetic appeal to the viewers. The website expressed my style, and although I've recently studied web design, the website has shown what I can accomplish as a web designer. Moreover, I don't grade myself a perfect score because I know that there's still a lot of room for improvement for myself in the field of web design.

3. Content of the project – 18/20

For the content, I have inserted almost everything that I can put in the portfolio. However, I don't give myself a perfect score because my content mainly focused on the visual impact to express myself rather than using sentences and words.

4. Speed and performance – 10/10

After testing the website multiple times, I am confident that my portfolio loads smoothly in just a few seconds. Furthermore, all the images load quickly as well, and all the links associated with the portfolio go to their respective destination.

5. Cleanliness and orderliness of the code – 10/10

All of my codes associated with this project are organized, and the format of each code is well-structured. These include inserting tabs when needed and adding comments to their proper places.

6. Uniqueness and creativity – 7/10

I have implemented a lot of features in my website that describes a visually appealing portfolio for applying for a job. However, as a beginner in web design, I have to admit that there are some cases where some of my codes were inspired by several tutorials on the Internet.

My final grade: **93/100 = 1.25**
